

		Observation geometry (determines aggregation for plot and JSON output)				Real time statistics display	
		Cloud Top/Base	Cloud Top/Base + $f_{pix} < 1$	Cloud Top/Base/Side ¹	“Entire domain” check box ²	Final Outcome	Radiative Components
Illumination geometry	Point Source		N/A		N/A	Reflectance and surface absorptance (net transmittance): observation geometry reflects the active dropdown selection (label updates accordingly)	Accounts for surface-reflected photons collected from an approximately unlimited ³ horizontal domain, independent of observation geometry selection
	Uniform Cloud Top				N/A	same as above	same as above
	Uniform Cloud Top/Side				N/A	same as above	same as above
	Uniform domain (M-factor)						
	Open boundary					same as above	same as above
	Periodic boundary					same as above	same as above

¹ For $\theta_{view} > 0^\circ$, the projected area for BDF normalization is the 3D cloud projected onto a horizontal plane

² The projected area for BDF normalization is the M-defined domain area, regardless of θ_{view} .

³ “unlimited” subject to $dir.z$ clamped to $1e^{-12}$ to ensure finite calculations. Also true for all Illumination and Observation geometries (see example surface reflected photon path graphic below).
